API Introduction

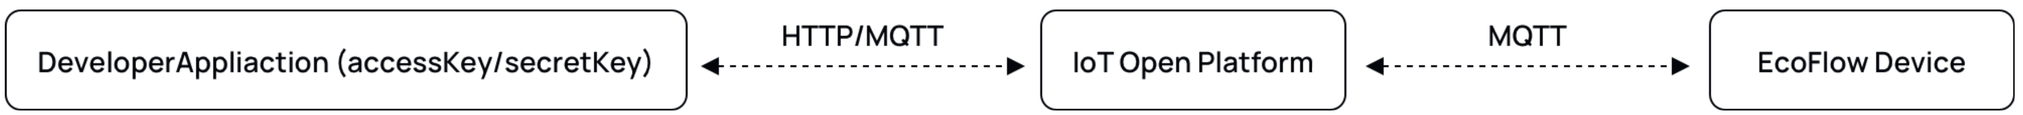

Ecoflow open platform provides APIs for developers to obtain their own device operation rights and data generated by the device through certain methods.

Development Process

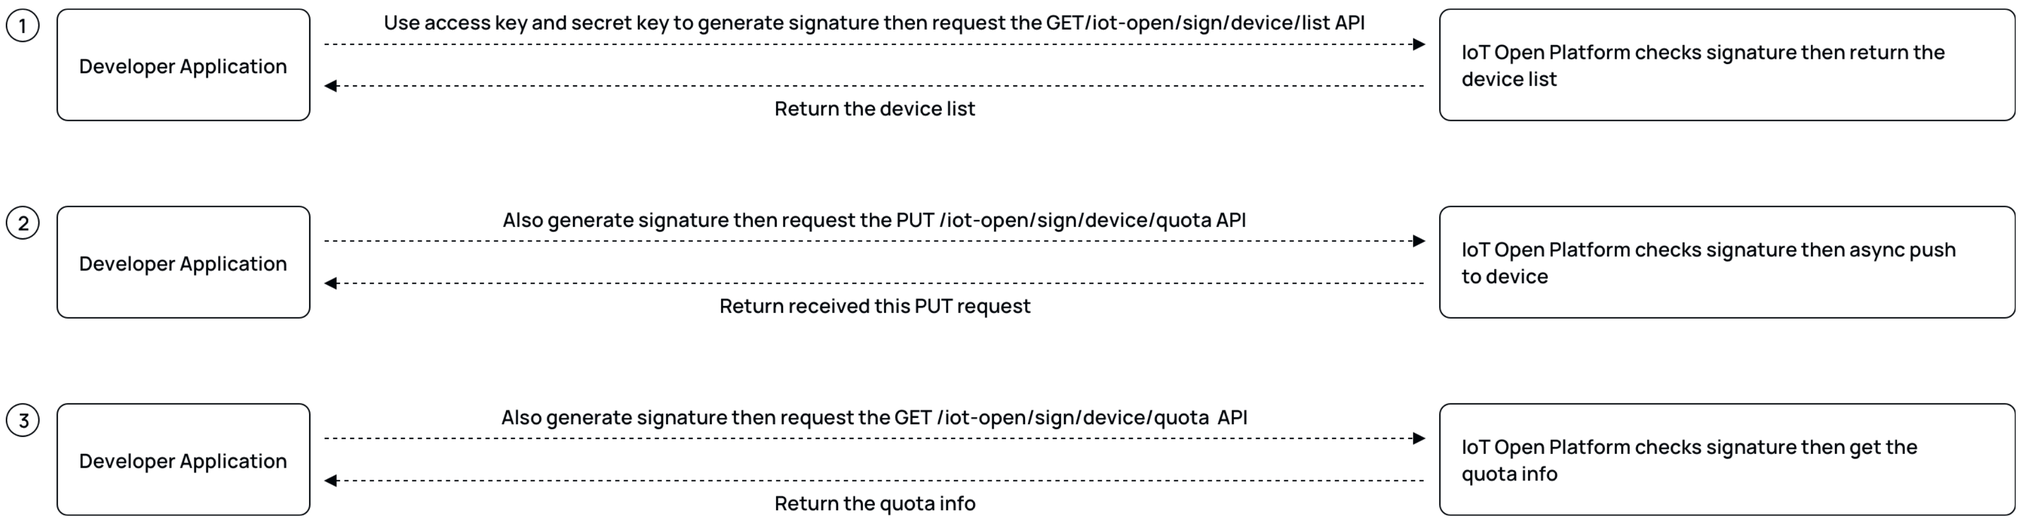

Interactive mode

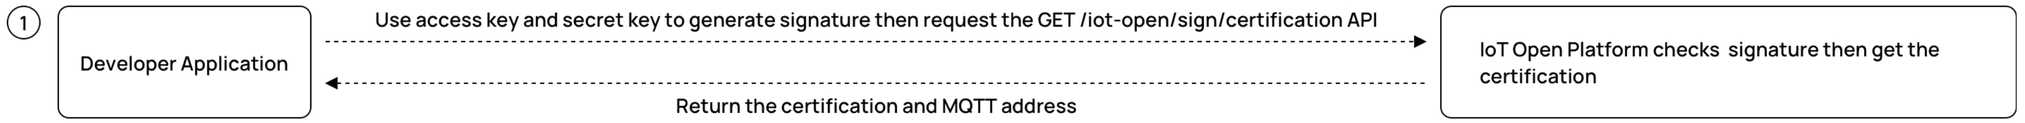

The application is bound to the application through the accessKey and secretKey, which is used for each interface request, and the signature verification operation; the application and the server can communicate through HTTP or MQTT protocol; the device and the server can communicate through MQTT.

Communication Using HTTP

Communication Using MQTT

1
Developer Application
Use access key and secret key to generate signature then request the GET /iot-open/sign/certification API
Return the certification and MQTT address
IoT Open Platform checks signature then get the certification
2
Developer Application
Use the certification to establish connection
If approved, establish connection successfully
MQTT
Check certification
Response the check result
IoT Open Platform
3
Developer Application
Subcribe MQTT Topic such as /open/${certificateAccount}/${sn}/quota
MQTT
4
Developer Application
Publish MQTT Topic sush as /open/${certificateAccount}/${sn}/set
MQTT
